

AI product

 By: Noa Biri, Eyal Chacham, Arbel Landau

 Mentor: Sarel Cohen

 Project number: 15006714

The Problem

- | Every year, tons of edible food go to waste - while many people still struggle to access food.
- | Donors (like restaurants or households) often have no simple way to give, and recipients don't know where to look.
- | Existing tools like Facebook groups or paid apps are scattered and not built for this need.

Our Solution

| Free to use – people can share food donations with a photo and description, and others can receive them easily.

| Uses AI to suggest relevant donations based on what the user is looking for.

| Displays donations in a user-friendly way, sorted by distance.

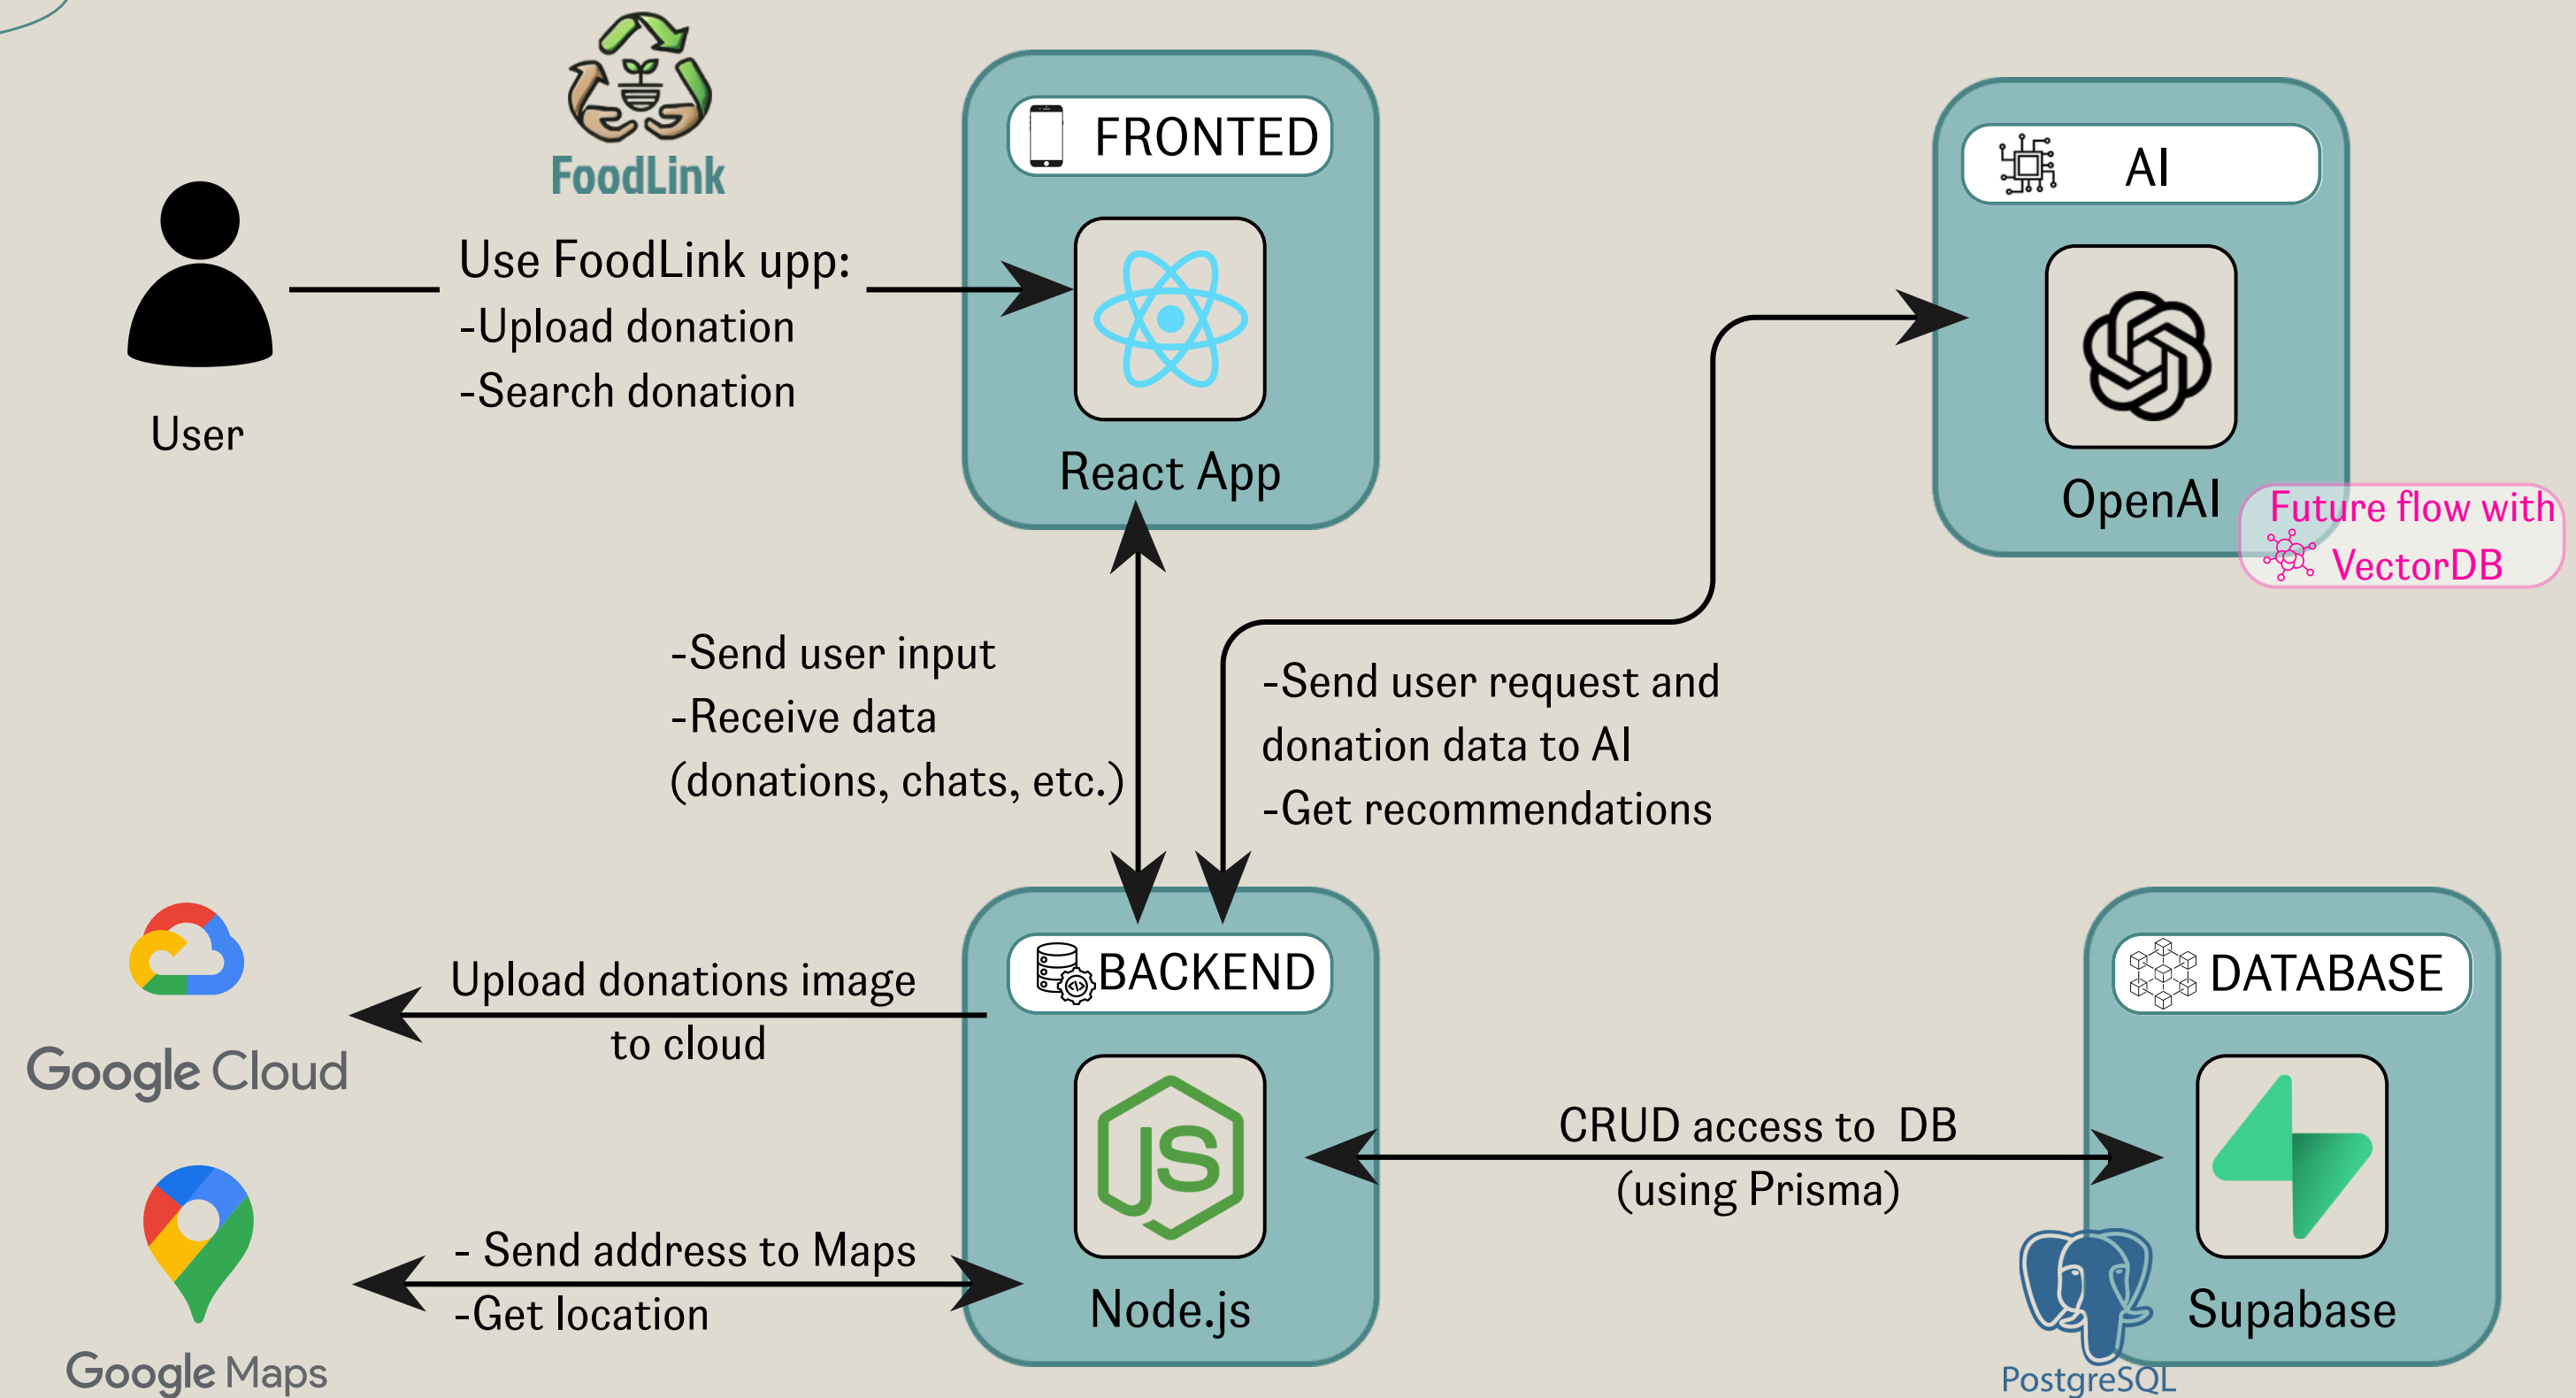

| Enables donation search based on user preferences – by keywords or categories.

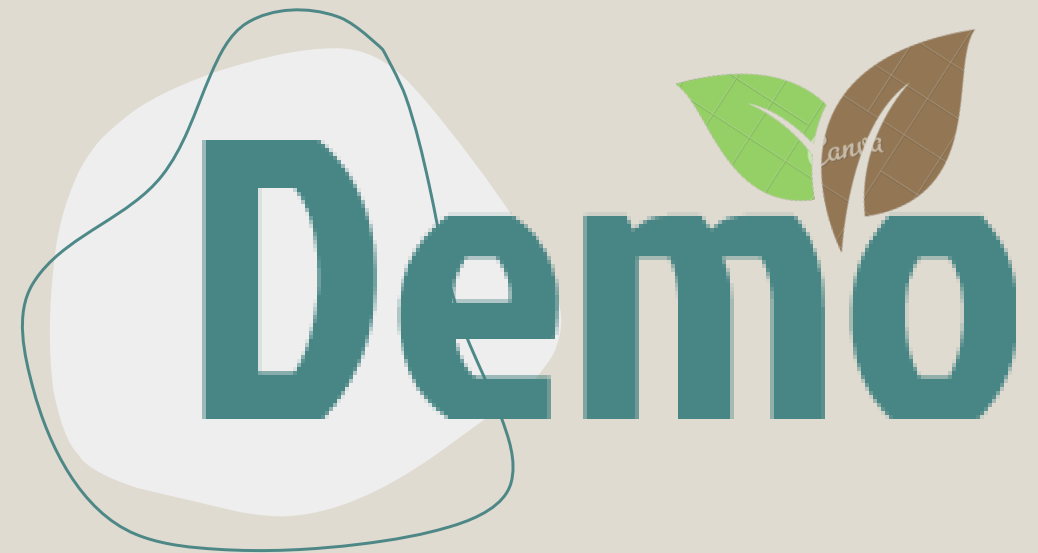

| Includes a chat between donors and recipients.

| Designed for both private individuals and organizations.
